SUMMARY

AI Product Engineer with a full-stack background and six years building web products. I take features from product definition and interface design to data model, backend and deployment: frontend in React, Next.js and Angular; backend in Node.js, Java, Python and PostgreSQL, with AWS Lambda and data pipelines on enterprise projects. I built a multi-tenant SaaS covered by 2,389 unit tests and AI features on the Claude API, working AI-first with Claude Code under my technical direction.

EXPERIENCE

365 Días de Ajedrez (365 Chess Days) Jan 2026 – Present · Remote
Founder & Developer (own product)
Multi-tenant SaaS where chess academies, clubs, schools and teachers run classes, courses, exercises and games in one place. I own it end to end: product, UX, design system, data model, frontend, backend and deployment. The public site is live; the platform is built and in pre-release testing.

- Built the product's first AI features on the Claude API: when a student fails an exercise, the server replays the attempt against the author's solution and the model explains the mistake in plain language; and teachers get a written summary of a student's exercises with what to assign next. The facts always come from the server, never from the model, behind feature flags and per-user rate limits.
- Designed the multi-tenant model: organizations with seats, combinable roles and tenant isolation in the service layer, where one module builds every actor's query scope and a CI convention test checks that every organization service receives it.
- Wrote data jobs that are safe to re-run: a streaming, idempotent importer over 6.2 million puzzle rows and a batched importer that loaded 4.18 million games (128 million indexed positions) into PostgreSQL. A position explorer on top answers in about 25 ms per move.
- Made writes correct under concurrency: the server replays every exercise attempt to validate it, and a PostgreSQL row lock guarantees one scored attempt per exercise per day.
- Built the design system: 199 light/dark tokens and 91 components on Radix Primitives, with axe checks on about 880 Storybook stories in CI. The public site scores 99 performance and 100 accessibility on Lighthouse.
- Built the learning features: courses with cascading progress, server-validated exercises, a block editor with a review workflow, and a LiveKit prototype of live classes with a shared board.
- Prototyped live classes with LiveKit behind a feature flag, with a teacher-controlled shared board; recordings go to a private Cloudflare R2 bucket and are served through one-hour signed URLs.
- Built on Next.js 16, React 19, TypeScript, Prisma and PostgreSQL (104 models, 63 migrations), with custom auth (scrypt, opaque sessions), tag-based caching invalidated from server actions and 2,389 Vitest unit tests that run in about 12 seconds on every change.
- Work AI-first with Claude Code: I define product, architecture and decisions, delegate the implementation and verify it with tests and in the browser. I wrote the conventions manual the agent follows, run parallel agents in git worktrees, and its permissions are code: a hook that fails closed before any command touching a managed database, checked by a CI test.

Portfolio with AI assistant (own project)

- Built Blue, an AI assistant that answers visitors' questions about my work, on the Claude API with streaming responses and prompt caching, grounded in a bilingual profile.

- Protected the endpoint with per-visitor and site-wide rate limits on Upstash Redis, origin and input validation and a response deadline, covered by 58 Vitest test files. The site runs on Astro with React islands, in Spanish and English, on Vercel.

Page Consulting (consultant for AstraZeneca) Jun 2023 – Jan 2026 · Remote

Full-Stack Developer

Support and development team of 30+ professionals across the UK, US, Japan and India, working in Scrum.

- Co-built Comms App in Angular, the internal tool that standardized incident communications: severity and progress tracking, whole recipient groups, and approve/reject buttons inside the email so every approval and blocker stayed visible. It went into real use by incident reporters and decision-makers. I built the live email preview, dynamic forms that reused one component across communication types, and the edit flow.
- Developed and maintained REST APIs in Java: endpoints, SQL data access, JSON responses and third-party service integrations.
- Built data pipelines: a reusable SnapLogic ELT pipeline that loaded five pharmaceutical brands' data into Tealium through scheduled per-brand tasks, AWS Lambda functions triggered by S3 uploads that called SnapLogic tasks to process files with healthcare-professional data, plus Python scripts that filtered and loaded data into AstraZeneca databases and Python APIs integrated with SnapLogic services.
- Implemented the Tealium tag across multiple websites and configured behavioral audiences and connectors that called external endpoints when a user met a condition, such as finishing a video and staying on the page.
- Ran email sends in Adobe Campaign Classic and SMS delivery of savings cards to healthcare professionals who requested them on brand sites.
- Kept ~500 corporate websites running as part of the support team: releases, redirects and Apache configuration versioned in Bitbucket, Jenkins redeploys and Catchpoint monitoring with failure alerts.
- Wrote thorough documentation and standard operating procedures (SOPs) for the team's recurring processes.

Mellow Aug 2021 – Jun 2023 · Remote

Frontend Developer

Sole frontend specialist in a team of three, building the sites behind Reto MD, an app that helps medical students prepare for Mexico's national residency exam (ENARM).

- Unified the specialty sites into a multi-tenant architecture with the tech lead: a typed per-brand configuration and components built once and enabled per brand. One repository produced six independent Vercel deployments, and a new brand could launch in about an hour once its content was ready.
- Led a change in how design and frontend worked together: proposed to our designer one shared Figma file with sections as components and semantic color variables instead of one file per brand, and we made the change together.
- Built the new Reto MD website with Next.js, TypeScript and Tailwind CSS, with hybrid authentication between Firebase and the platform API, and replaced per-visit WordPress API calls with static generation and TanStack Query caching, reducing API load and speeding up navigation.
- Designed the UI and built the frontend of the Mexican Society of Ophthalmology back office, including a multi-step registration with document upload and saved progress, designed for large type and contrast because many users were over 60.

Proficient Systems Jan 2020 – Aug 2021 · Remote

Full-Stack Developer

Team of five at a software consultancy; joined as a trainee and grew into design, frontend, backend and integration work, often interviewing clients to define scope.

- Designed and built the Ocho Seis Uno real-estate platform end to end: client interviews, scope, Figma design, Prisma/PostgreSQL data model, Next.js app, invoicing API and an analytics dashboard.
- Built backend services for Shopify clients' apps with Node.js, Express and Python: APIs, webhooks that triggered emails and sales flows after a purchase, admin dashboards on Shopify's GraphQL API, and automated per-purchase invoicing for a Uruguayan client.

- Embedded a React and TypeScript app in a Shopify Liquid theme for a phone-on-credit flow with identity verification, credit rules that capped instalments against income and an IMEI lock API; the company's first React-in-Shopify integration.

SKILLS

Frontend: TypeScript, JavaScript, React, Next.js (App Router, Server Components), Astro, Angular, Redux, HTML, CSS, Tailwind CSS, Radix UI, shadcn/ui, TanStack Query, Zod, design systems, accessibility, Figma

Backend & data: Node.js, Express, Java, Python, REST, GraphQL, webhooks, SQL, PostgreSQL, Prisma, Upstash Redis, Firebase, SnapLogic (ELT), AWS (Lambda, S3), Tealium

AI: Claude API (streaming, prompt caching, rate limiting), Claude Code (written plans, conventions manual, parallel agents, permissions as code)

Quality & delivery: Vitest, Jest, Playwright, Storybook, axe, Lighthouse, GitHub Actions, Docker, Vercel, Jenkins, Scrum

EDUCATION & LANGUAGES

B.Eng. in Business Management and Finance · Universidad de Oriente · 2020–2024

Web Development Bootcamp · Coderhouse · 2022–2023

Spanish: Native. English: C1 Advanced (EF SET, Feb 2023).
